

# Bespoke Valves Supplied to Replace Aging Parts

As the saying goes, prevention is better than cure. This is particularly appropriate when it comes to replacing aging parts, in order to ensure the continued operation of at-risk equipment and avoid costly breakdowns in the future.

Essco recently supplied two bespoke camflex control valves and six Kinetrol actuated valves to replace the originals installed in 1999. They were required for use in a gas train with two outdoor duct burners on a site in Ireland.

Part of an update of the critical components on site, the replacement of these aging parts will ensure the continuous operation of their at-risk equipment.

**Mike Beal, Spare Parts Coordinator at SAACKE Combustion Services Ltd comments, "This is a nonstandard installation and many of the parts required are bespoke, so it's great to have the support of Essco to source these items to ensure that they are designed and set to the specifications we require."**
